New Films Reveal Fluoridation to be a Destructive and Racist Policy

Two outstanding documentary films have highlighted fluoridation to be a forced, destructive policy based in poor-quality science and causing disproportionate harm in our communities.

Both documentaries shine an inquisitive light on the dark side of fluoride. Once you've investigated, it's hard to believe fluoride disposal isn't front page news in those few countries (such as Australia and the United States) that fluoridate their people with hazardous industrial wastes added to drinking water.

"*The Great Culling: Our Water*" is the first in a series of three films investigating the toxins in our water, food and air, and the apparent agenda behind them. Film-makers Paul Wittenberger and Chris Maple are both keen to find the real story of fluoridation and the links to increasingly common neurological conditions. This film is stunning.

"*Fluoridegate*" is also an impressive film, made by US dentist Dr David Kennedy, a former president of the International Academy of Oral Medicine and Toxicology (IAOMT). His film shows how fluoridation policy disproportionately harms children, low-income families as well as black and hispanic citizens. The United States is at risk of a continually declining IQ overall, due to toxins including fluoride and metals which are being overlooked by the regulatory agencies that are meant to protect us.

Both films are well-made, informative and very watchable. Which is the better film? They're both great. So a better question might be: 'Which film do I watch first?' Whichever film you can get your hands on first! There's only a few overlaps between them, including 'disproportionate harm', a key theme of Kennedy's *Fluoridegate*. The films are synergistic, their different perspectives align and pull together the common aim of finding and exposing the truth.

Fluoridegate shows clearly that fluoridation causes damage but it doesn't try to explain the reasons why the policy continues. "*Our Water*" goes further to briefly address the "big money" driving the waste disposal scheme and the even bigger

context that's illustrated by the totally appropriate series title, *The Great Culling*. Both films' approaches to the subject are valid and together they highlight the real story of fluoridation.

Both documentary films are powerful educators, eye-opening and compelling... Many Australians will find these movies influential in their "wake-up" process.

Both documentaries feature a number of professionals, some of them now retired, along with informed laymen. Dr Kennedy appears often in both films and is great on the screen; he's knowledgeable and very clear and direct.

Not all dentists promote or condone fluoridation, usually only those who haven't studied beyond the superficial "fluoride is safe and effective" training delivered in dental schools and in the subtle and regular mass media promotion.

While filmed in the US, much of the content of both these films is applicable to the Australian experience of fluoridation, with a different set of alphabet authorities proclaiming that the industrial chemical pollutant is wonderful without any genuine scientific proof.

Both documentary films are powerful educators, eye-opening and compelling. They prompt serious questions of any unquestioning, dogmatic adherence to the "policy" of toxic industrial effluent disposal on the pretence of it helping children's teeth. Many Australians will find these movies influential in their "wake-up" process. Unconscious, robotic authorities proclaiming "safe and effective" won't

like the films' messages, but human beings with hearts and the ears to hear will continue to respond and add to the growing momentum of awareness.

You might ask your own dentist if they've seen either film and maybe offer them a copy. Both these movies are available for sale, and are also available free online (at high definition, 720p). The film-makers are passionate that their life-sustaining messages are seen by as many as possible.

Both films are extraordinary; we highly recommend them. Be sure to watch them!

Both films are extraordinary; we highly recommended them. Be sure to watch them! They can be watched many times. If you can afford to, buy your own copies (even multiple copies) and contribute toward helping to inform and educate many on the realities of fluoridation.

Now we'll delve more into both films, so if you don't mind some "spoilers", read on.

Framing the World Productions, 2012 (93 mins)
www.framingtheworld.com; www.thegreatculling.net

This documentary quickly and effectively sets up the series of three films by explaining its title, *"The Great Culling"*, which creates intrigue and leaves the viewer wanting more in this investigation of fluoridation. So, don't be deterred by the series title.

Chris Maple is a friendly presenter and is clearly passionate about getting to the truth. His social "vox-pop" interviews lighten the mood effectively and bring out the humanity, while highlighting that many just don't know. We'd have some similar responses in Australia, except for regions such as Queensland, where many are now well-informed of the real nature of fluorides.

Early in the film, Dr Kennedy makes many good points:

"Hazardous waste from China is not going to prevent tooth decay. Eating right and taking care of your teeth is what prevents tooth decay... This is about your rights. This is a civil right. Are we going to put stuff in the water that harms children?"...

"Hydrofluosilicic acid... it eats through concrete, glass, stainless steel... you name it, it will eat it. So, why are we putting that in the water?" - Dr David Kennedy DDS

"Hydrofluosilicic acid does not occur in nature, it's a man-made molecule. And it eats through concrete, glass, stainless steel, fibreglass, plastic, you name it, it will eat it. So, why are we putting that in the water?..."

"Hydrofluosilicic acid has no known benefit in human or any physiological system. It's not even useful in any mammal. So adding that to the public water supply for an alleged benefit is a fraud and it's a crime against the citizens of this country. And it's cumulative over a lifetime, it is a very noxious poison."

In addition to the engaging content, the documentary's extensive and professional editing with many visual effects hold the viewer's attention and make it especially compelling.

In addition to Dr Kennedy there are many other experts willing to inform us. Biological dentist Dr James Rota DDS, is one who talks of the health effects of fluorides and states:

"We now know, statistics have shown us, that fluoridation is not working, it's very toxic to you, and can cause everything from cancer to depression."

With water fluoridation, there's no single dose that is good for everybody (or anybody). Dr Kennedy says:

"Which makes water fluoridation with hydrofluosilicic acid a crime against humanity and it's time for them to stop. What it does, it causes minorities, especially lactose intolerant minorities, to suck up lead like a sponge, and end up with learning disorders and be in prison for violent crimes."

Dr Kennedy continues that fluoridation causes disproportionate harm to black and hispanic minorities, and so it is a racist policy. It also causes disproportionate harm to babies (drinking a large percentage of their weight in water each day) and to low-income families (who are unable to afford methods to avoid fluoride).

"Water fluoridation with hydrofluosilicic acid [is] a crime against humanity and it's time for them to stop." - Dr David Kennedy DDS

In the US, fluoridation has been reduced from 1.0 ppm to 0.7ppm (that's an admission) but it's still going to damage everyone, albeit at a slower rate.

Fluoridation is a medicine and as such is a violation of informed consent, as it forcibly mass medicates the whole community with a "one size fits all" prescription. As Emeritus Professor Paul Connett says *"What we're doing in a fluoridated community is we're doing to everyone what a doctor can do to no-one."* Doctors are required to consider each individual patient's history, to tell them of potential side effects, and to allow their (fully informed) free choice. But for a doctor to force a patient to take medication can result in their licence being taken away. Prof Connett quotes Dr James Sumner, who won a Nobel Prize in 1946 for his studies on enzymes:

"Fluoride poisons enzymes. You don't want to put this substance into the body. Poisoning enzymes is what makes people sick. Poisoning enzymes is what kills people."

Fluoride is now in thousands of products, it's in just about everything – anything with water also has fluoride in it.

The film allows for those still bedazzled by fluoridated toothpastes (and other dental products) to cling to them if they wish. But as one film caption reads, ***"there is no safe dose of fluoride"***, therefore, we must minimise our fluoride exposure, including ALL sources of fluorides.

The film briefly covers the "big money" driving fluoridation and how a select group of CDC (Centers for Disease Control) dentists are guiding government policy to follow the "big money". Dr Kennedy says *"We want our children to grow up strong. And they want to make profits."*

What we can do

The film suggests a range of measures to reduce fluoride intake. One such method is to obtain a household reverse

osmosis (RO) filter which removes most (but not all) fluoride. We'd add that distillers are highly regarded, the distillation process removes all fluoride from water. (More info is available in our online *Water Filter Guide*). But sometimes fluoride is added to distilled water, such as with the ghastly product for babies, "Nursery Water", which is unfortunately still for sale.

A variety of ways we can use to diminish the harm done by fluorides: calcium, magnesium, Vitamin C, selenium and others. You'll have to watch it to hear the rest, there's plenty of great suggestions, as well as various approaches for "the silent majority" to remove fluoridation. And what about toothpaste? Organic chemist Dr Charlie Goetschel says:

"Stop buying fluoride toothpaste. Stop buying it. You know, if people started buying the non-fluoridated, guess what they would do, they would start coming out with the non-fluoridated."

The film sets a good pace with lots of good footage and great sound. It's very useful for introducing people to the fluoridation subject.

"Stop buying fluoride toothpaste. Stop buying it." - Dr Charlie Goetschel, Organic chemist

We look forward to the next two films of "The Great Culling". They will both likely mention fluoride in the 'food' and 'air' but will also cast a wider net for other additives and contaminants. If you wish to contribute to these films, even by purchasing this one, please do so. The film makers have done a superb job. Well done!

Their DVD can be purchased from G Edward Griffin's site, realityzone.com, or through www.thegreatculling.net.

Fluoridegate
An American Tragedy

www.fluoridegate.org
2013 (65mins)

"Fluoridegate" is a documentary film by US

dentist **David Kennedy**. Despite the film's subtitle of "An American Tragedy", much is also relevant in heavily fluoridated Australia.

Released in January 2013, the film won honourable mentions at both the Los Angeles Movie Awards 2013 and the Los Angeles New Wave International Film Festival. Early in the documentary, Dr Kennedy says:

"Everyone agrees, including the American Dental Association, the National Academy of Science, the American Medical Association, the American Academy of Pediatrics, that the dose of fluoride a baby receives on fluoridated tap water formula exceeds the amount known to cause harm. Why is that ok? Why are we allowing that? Meet the whistleblowers and the scientists that will tell you what's going on. And we'll tell you how to stop it."

It's great to see the illuminating story of the US EPA's unprofessional treatment of its Senior Scientific Advisor, Dr William Marcus. Attorney Stephen Kohn of the National

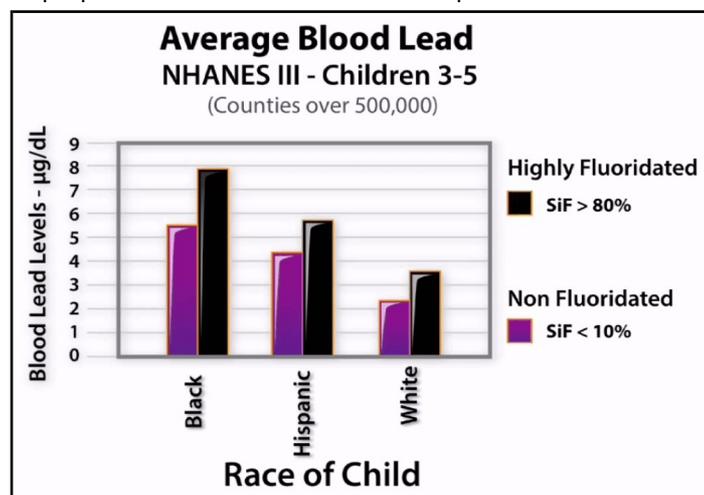

Whistleblowers Association (US) says "this case marks a black mark on the EPA and raises fundamental issues about scientific freedom, and about fluoride, and why this agency went against one its most respected scientists on that issue."

As Dr Kennedy says, regulatory agencies are reacting like that "in order to protect a policy." Even if the policy results in dental fluorosis, the first visible sign of chronic fluoride poisoning, as well as other effects on the body and brain.

Professor Emeritus Roger D Masters discusses why those of African-Americans and Hispanic/Latino heritage are disproportionately affected by silicofluorides in the water.

"Toxins have such a huge effect on human behaviour... The silicofluorides increase the absorption of the toxins. Lead levels absorbed by blacks in the US are higher than lead levels absorbed by whites."

The NHANES (National Health and Nutrition Survey) shows increased lead levels are absorbed in fluoridated areas and the disproportionate harm to blacks and hispanics.

But in Australia, can you hear the stampede of well-funded researchers investigating if fluoridation affects Australian Aboriginals even more adversely than everyone else? The Precautionary Principle should be used here, with the political

will and sufficient awareness in indigenous communities. Earlier in 2013, the Doomadgee Aboriginal Council in Queensland fortunately discontinued fluoridation. But elsewhere in fluoridated areas, it is likely that Aboriginal communities continue to be affected disproportionately.

Daniel Stockin from The Lillie Center in Georgia talks of the effects on the black community and how hard it's been to talk in their communities on the subject of fluoridation, without being met with resistance and pressure to be silent. But he says, "the good thing is, the thing is cracking open now..."

Stockin also discusses other susceptible populations, such as kidney patients. Dialysis requires fluoride-free water, but many kidney patients are unaware of this.

Pediatrician Dr Yolanda Whyte MD informs on the disproportionate harm to babies:

"Babies who drink formula that's been mixed with fluoridated water, they're actually receiving the highest dose amongst all of us... [but] there are no health or safety warnings..."

Decrease in IQ Results with Lead and Fluoride

Dr William Marcus, the former EPA senior scientist:

"It appears to me that when the lead was looked at, there was no level at which lead did not produce an adverse effect. And I expect the same is true of a fluoride study, we put them together, my guess is that it isn't just additive, it's multiplicative. But nobody is willing to do the study to determine what actually happens. There are lots of reasons to believe it's occurring nationwide, based on the LSAT (Law School Admission Test) studies, in which the children are doing more poorly now than they were in the '50s, before fluoride became much more widespread in its use. This is very, very bad because the number of children who become adults whose IQs are above 120 is significantly reduced and that's a terrible loss to the country."

Mercury, Lead, Vaccination and Fluoridation

Boyd Haley, Prof Emeritus (University of Kentucky) asks some unpopular but nevertheless important questions:

"There's no argument about us [United States] having one of the highest infant death rates in the modern world... Why are our children dying at such a high rate? Why are our elderly dying at a faster rate and at younger ages than people in 28 other countries, when we supposedly have the best medical care in the world?..."

"If amalgams were so good, if fluoridation prevented caries, if vaccines prevented death from infectious diseases, and caused infants to live longer, we would have one of the lowest infant death rates in the world, and in contrast we have one of the highest."

Dr Kennedy tells of Schubert's astounding 1978 study of rats dosed with mercury and lead, and how the combination of the two metals is "hugely synergistic". He says:

"When you put silicofluoride in the water supply, you're giving the baby, lead. And when you have vaccines with mercury in them like the flu vaccine, you're giving them mercury. So the water supplies of this country are contaminated with silicofluoride intentionally by our government program. That needs to stop, it's poisoning the babies."

In summing up, Prof Roger Masters states:

"It is evil to harm children by poisoning them in their first six years of life once you know you are doing it... Once you discover that there is something you can change at relatively low cost, that will help millions of humans beings, you have an obligation to do it."

Fluoridegate (65 mins) is a superb documentary that says it as it is, authoritatively presenting information we don't see in our media. It ought to be offered to every dentist, and indeed everyone!

Fluoridegate is viewable online and copies are also available for purchase, including a bulk pack at a reduced rate. See www.fluoridegate.org. (The website also has other great resources, including a letter to councillors and politicians with an idea how to save money on their annual budgets. See the YouTube channel DavidKennedyDDS, for clips such as mercury vapour rising from a tooth filling.)

Brief News and Reviews

Phillip Day Australian & NZ "What's News" Tour

UK health researcher and writer Phillip Day begins his regular tour mid-October in New Zealand and arrives in Melbourne for talks on the 27th Oct and 3rd November, and then on to other capitals and many regional centres. He's well aware on many important topics including fluoridation – though it's good to say 'hello' beforehand and ask him to mention fluoridation in his talk. It's three hours of essential information you won't see on the TV for at least a few years to come! For more information or bookings please call (08) 8362 7378 or see <http://credence.org/WNOZ2013/>

Victorian "Bully Stoppers" Campaign

The Victorian Government is currently running a advertising campaign with the slogan "Any child can be bullied. Together we can stop it." Could this campaign also be applied to stop bullying and forcing children (and adults) to drink industrial fluoride effluent? Under the campaign name, 'Bully Stoppers', is the directive to 'Make a stand. Lend a hand.' So come one and all, lend a hand to help stop bullying health departments and other fluoride drug pushers forcing their policy on an unsuspecting majority.

Clip: Dr Dean Burk talks fluoridation on Dutch TV

Dr Dean Burk, co-founder of US National Cancer Institute, a scientist with that body for 35 years, and former director of its cytology department, proved that fluoridation causes cancer. In 1976 he announced this on national prime-time TV in The Netherlands. See our website 'Videos' for this 6 minute film.
